(54) Title: METHOD FOR OPERATING A SPEECH RECOGNITION SYSTEM

(57) Abstract: A method for operating a speech recognition system is described in which a speech signal (S_i) of a user is detected and analyzed so as to recognize speech information contained in the speech signal (S_i). The speech recognition system determines a reception quality value (S_Q) or a noise value which represents a current reception quality. The speech recognition system is switched over to a mode of operation which is less sensitive to noise and/or outputs an alert signal (S_w) to the user when the reception quality value (S_Q) drops below a given reception quality threshold or when the noise value exceeds a noise threshold. An appropriate speech recognition system is also described.
